Version Notes, ESS9 Appendix A2 INCOME

ESS9 edition 2.0 (published 15.06.20):

Changes from previous edition:

Additional countries:

Croatia, Latvia, Lithuania, Montenegro, Portugal, Slovakia, Spain, Sweden.

General information on the ESS income measure

Household income: F41 HINCTNTA

As of ESS4 - 2008 a decile approach has been applied when measuring income in the ESS. The categories in variable HINCTNTA are national and based on deciles of the actual household income range in the given country.

These deciles are derived from different sources. For information on the sources used in specific countries, see item 1 in the country specific report for each country. The median income is the reference point and the 10 deciles are calculated with the median itself at the top of the fifth decile (category F). Minor rounding is applied where necessary. The deciles are documented in national currency. The national currency and exchange rate to Euro (€) are documented in item 3 in the country specific reports.

General setup of the showcard (CARD 44) on income:

YOUR HOUSEHOLD INCOME

Showcard code	Approximate WEEKLY	Approximate MONTHLY	Approximate ANNUAL	Data file code
J	Less than €xx	Less than €xxx	Less than €xxx	01
R	€xx to under €xx	€xxx to under €xxx	€xxx to under €xxx	02
C	€xx to under €xx	€xxx to under €xxx	€xxx to under €xxx	03

Austria

1. Data source	
Name of data source for income categories:	EU SILC
Year of data source:	2017
Type of data	
Sample survey data:	Yes
Register data:	No
Census data:	No
Description of survey:	The EU SILC in Austria is based on a household sample representative for the population living in private residences. In 2015, 13,213 subjects were interviewed in 6,045 households, through personal interviews (either CAPI or CATI). The sampling frame is the central register of residents (ZMR). Except of income from self-employment, private pensions, rents, most components of the income data were imputed from register data.

2. Income deciles			
	Source data		Income deciles
01	15.329	J	weniger als 15.300 Euro
02	21.139	R	15.300 bis unter 21.100 Euro

09	77.512	D	60.600 bis unter 77.500 Euro
10		H	mehr als 77.500 Euro
Income decile table refers to:			
Weekly	No		
Monthly	No		
Annual	Yes		
Are the income figures adjusted to 2018 level?	No		
If no, please give the reason for not adjusting the benchmark data:	Data is from 2017, thus there is no need to adjust.		
Do the national benchmark data refer to the household's total income, after tax and compulsory deductions, from all sources?	Yes		
Do the national benchmark data refer to household income for all households, unadjusted for size or type?	Yes		

3. Exchange rate	
National currency versus the Euro (€) at the time of fieldwork	EURO

Belgium

1. Data source	
Name of data source for income categories:	EU-SILC
Year of data source:	2014
Type of data	
Sample survey data:	Yes
Register data:	No
Census data:	No
Description of survey:	<p>The European Union Statistics on Income and Living Conditions (EU-SILC) is a household survey covering a broad range of issues in relation to income and living conditions and is an important tool for both the Belgian and European level for mapping social exclusion and poverty.</p> <ul style="list-style-type: none"> - The target population consists of all citizens living officially in Belgium. - Sampling frame: A sample of Belgian private households is drawn from the National Register (Rijksregister/Registre National), an official database of people residing in Belgium that is continually being updated. It is the best sampling frame available in Belgium. The sample is drawn one month before the start of the survey. People passing away or moving abroad before the start of the survey result in over-coverage. People moving into Belgium and people moving from a household to create a new household result in under-coverage. Under-coverage also results from diploms exempt from inscription in the register. Overall, the population coverage is good. - Sampling design: The Belgian EU-SILC is based on a stratified two-stage sampling sample. The 11 sampling strata are the 10 Belgian provinces (BE21-BE25, BE31-BE35) and the Brussels Capital Region (BE10). In the first stage (implemented in 2004 only), municipalities are drawn according to a systematic PPS (probability proportional to size) selection scheme. Some municipalities were selected repeatedly. The 275 PSU draws made in 2004 are maintained for the duration of the EU-SILC. In the second stage, a fixed number of households is selected for each PSU draw. Implicit stratification by age is achieved by sorting the households in selected PSUs by age of the reference person. In 2004, 40 households were selected for each PSU group. Households 1-10 constitute the first rotational group, households 11-20 constitute the second rotational group, households 21-30 constitute the third rotational group, and households 31-50 constitute the fourth rotational group. In each of the following years, one rotational group is replaced by newly selected households so that the sample is completely renewed every four years. The EU-SILC 2014 sample therefore consists of 'old' households drawn between 2011 and 2013 (5,196), and 'new' households drawn in 2014 and staying in the sample until 2017 (4,348). - Net sample size: 6,021 households agreed to participate in the EU-SILC 2014. <p>Additional information can be found in the EU-SILC 2014 quality report for Belgium (SILC_ESQRS_A_BE_2014_0000).</p>

1. Data source

If EU-SILC used, please name the variable(s) used:	We used Total disposable household income (HY020) to calculate income categories for F41. Gross income from work for G10a. Net income from work for G12a. Compute var INKWRK (income from work)= (Gross/Net employee cash or near cash income (PY010G) + Gross/Net non-cash employee income (PY020G) + Gross/Net Self-employment income (PY050G). Income from pension for G12b. Compute var INKPENS (income from pension) = Old age benefits (PY100G)+Survivor's benefits (PY110G) + Disability benefits (PY130G). Income from social benefits for G12c. Compute var INKSOC (income from social benefits) = unemployment benefits (PY090G) + family/ children related allowances (HY050G) + housing allowances (HY070G) + targeted social benefits (HY060G).
Name of data source for income categories:	Statistics on Income and Living Conditions
Year of data source:	2017
Type of data	
Sample survey data:	Yes
Register data:	No
Census data:	No
Description of survey:	The survey conducted according to a unified methodology defined by Regulation 1177/2003 of the European Parliament and the Council and provides information on the current state (cross-sectional data) and longitudinal (longitudinal data) changes in income data, level and composition of poverty and social exclusion.

Croatia

1. Data source	
Name of data source for income categories:	Indicators of Poverty and Social Exclusion, 2018 - Croatian Bureau of Statistics
Year of data source:	2018
Type of data	
Sample survey data:	Yes
Register data:	No
Census data:	No
Description of survey:	<p>Used data were collected during the Statistics on Income and Living Conditions survey, which was carried out in 2018 (SILC 2018). The SILC survey is a panel sample survey of randomly chosen private households. The panel sample implies that selected households remain in the sample for four consecutive years and that they are repeatedly interviewed. The sample frame used in 2018 for the selection of dwellings occupied by private households was based on the Census of Population, Households and Dwellings in 2011. The total sample consisted of 12 553 households. The sample selected for 2018 consisted of 8 383 successfully interviewed private households and the response rate at the household level was 72.02%. The implementation of the Survey is in line with EU regulations and Eurostat's methodology for the EU-SILC Survey. Since 2011, Croatian Bureau of Statistics does not report total household income, but only Equivalised Disposable Income (total net household income divided by equivalised adult). So, there is no official and reliable source for total net household income, including its distribution by deciles. In this case, we decided to use deciles of Equivalised Disposable Income and to estimate total net household income using reverse procedure. We estimated average number of equivalised adults and multiplied upper threshold of deciles by that number in order to get estimate of total monthly net household income.</p> <p>The source for Equivalised Disposable Income distribution by deciles is report of Croatian Bureau of Statistics "INDICATORS OF POVERTY AND SOCIAL EXCLUSION".</p>

Finland

1. Data source

If EU-SILC used, please name the variable(s) used:	The data which was used for employees' and self-employed persons' decile groupings was based on national IDS/EU-SILC data (IDS, Income distribution statistics). The personal income components, earned income subject to state taxation, earned and capital income subject to state taxation, disposable monetary income and gross income followed the IDS definitions. For income decile classifications, the persons of the weighted sample were ordered by the income level of each component. The decile points (.10, .20,...,100) of these income distributions were specified for classifying persons to decile groups. The income components are not available from the EU-SILC data. There are slight differences in gross income included in HY010 components and disposable monetary income included in HY020 components in EU-SILC. In addition the components are at household level.
Name of data source for income categories:	Survey on Income and living conditions
Year of data source:	2016
Type of data	
Sample survey data:	Yes
Register data:	No
Census data:	No
Description of survey:	Survey on income and living conditions collects data about Finnish households' income and living conditions. The survey collects data about, for example, the composition of households, the activities of the household members during the year, housing and housing costs, loans, economic livelihood and health. Annually some 10,000 households are interviewed for the survey on income and living conditions survey by telephone. In addition, data are derived from administrative registers available to Statistics Finland.

Income decile table refers to:

Weekly	Yes
Monthly	Yes
Annual	Yes
Are the income figures adjusted to 2018 level?	No
If no, please give the reason for not adjusting the benchmark data:	For ESS Round 9 income data from 2017 is used. These are the most recent figures available. Even though numbers from the nominal wage index are available for the first quarter of 2018, an adjustment on basis of the index will not be implemented. First, these numbers refer to income from wages only and do not include all sources of income. Second, the numbers are skewed because they only refer to income in the first quarter of the year and do not include special payments, such as Christmas or holiday bonuses paid in the following quarters. Therefore, the numbers of income from 2017 are more adequate to use.
Do the national benchmark data refer to the household's total income, after tax and compulsory deductions, from all sources?	Yes
Do the national benchmark data refer to household income for all households, unadjusted for size or type?	Yes

If EU-SILC used, please name the variable(s) used:	HY020 - Total disposable household income (F41) PY010_050N - Employee income and cash benefits from self-employment (net) PY100N - Old-age benefits (net) PY090_110_120_130_140N - Unemployment, survivor', sickness, disability and education-related benefits (net)
Name of data source for income categories:	Central Statistical Bureau of Latvia
Year of data source:	2013 - 2017
Type of data	
Sample survey data:	Yes
Register data:	No
Census data:	No
Description of survey:	<p>EU - SILC survey data were used (most recent available). The basic unit of EU-SILC survey is persons living in private households. Survey does not include collective households (old peoples' homes, boarding schools for disabled children, student hostels, hotels, barracks, hospitals, sanatoriums, prisons, etc.).</p> <p>During the survey, information was obtained on whole household as well as on each household member aged 16 and over. Households belonging to longitudinal section are surveyed for several years (maximum 4 years). In Latvia four-year rotation panel is used and all household members, who in the first survey year were at age of at least 14, are sample respondents. The sample size in the years from 2013 to 2017 was 8008 - 8510 people; the country's population was 2 million.</p>

Lithuania

1. Data source	
Name of data source for income categories:	Omnibus surveys 'Lithuanian Barometer' conducted by the fieldwork organisation
Year of data source:	January and July, 2019
Type of data	
Sample survey data:	Yes
Register data:	No
Census data:	No
Description of survey:	<p>Net income deciles were derived from two national omnibus surveys (18+, no upper age limit) (done in January and July) conducted by the Fieldwork Organization in 2019. In both surveys, random route sampling from 108 randomly selected PSUs was used. PSUs were selected proportionally to the population size within the strata (10 counties and 4 types of settlements according to their size). One respondent per household was interviewed, the selection of respondent in selected household was based on so called 'young-man-rule'. In total, 2005 respondents were interviewed in the two surveys (1004 respondents in January, and 1001 respondents in July). The same question was formulated in both omnibus surveys as it follows: 'Kokia suma tenka vienam Jūsų šeimos nariui per mėn.? Sudėkite visų šeimos narių atlyginimus, pensijas, stipendijas ir t.t. ir padalinkite iš šeimos narių skaičiaus. Nurodykite sumą eurai'. The question indicates about net average monthly family (household) income per person after tax and compulsory deductions, including all sources of income (in euros). The question clearly stated to respondents what should be considered as net family income sources (wages, salaries, pensions, stipends, benefits etc.). Because the provided answers about net income question required to provide information about family (household) income per person within family (household) unit, the question about the size of family (household) was used to get the real (unadjusted) numbers of monthly average net family (household) income within family (household) unit as it follows: monthly average net (unadjusted) family (household) income = monthly average net family (household) income per person * the size of family (household). The entries in table down below are rounded means of the deciles from the two omnibus surveys.</p>

2. Income deciles			
	Source data		Income deciles

Poland

1. Data source	
Name of data source for income categories:	Household Budget Surveys (HBS) in 2017. Central Statistical Office (CSO), Warsaw 2018. Household Budget Surveys (HBS) in 2017. Central Statistical Office (CSO), Warsaw 2018.
Year of data source:	2017
Type of data	
Sample survey data:	Yes
Register data:	No
Census data:	No
Description of survey:	<p>Household budget surveys (HBSs) are based on the sampling method which allows for the generalisation of the results to the whole population of households within a margin of error. The HBSs are conducted by regional statistical offices. However, the responsibility for the survey content and coordination lies with the Central Statistical Office, Social Surveys and Living Conditions Statistics Department in cooperation with Statistic Office in Łódź which specializes in living condition statistic.</p> <p>HBS is performed by interviewers – employees of statistical offices in voivodships. The monthly rotation of households assumes that every month of the year a different group of households participates in the survey. Each household participating in the survey keeps a special diary for a month.</p> <p>Household's available income is defined as a sum of household's current incomes from various sources reduced by prepayments on personal income tax made on behalf of a tax payer by tax-remitter (this is the case with income from hired work and social security benefits and other social benefits), by tax on income from property, taxes paid by self-employed persons, including those in free professions and individual farmers and by social security and health insurance premiums. The available income covers both income in cash and in kind, including natural consumption (consumer goods and services taken to satisfy household's needs from self-employment – in and outside farming) as well as goods and services received free of charge. Available income is allocated to expenditures and savings increase.</p> <p>The available income comprises:</p> <ul style="list-style-type: none"> - income from hired work, - income from a private farm in agriculture, - income from self-employment other than a private farm in agriculture, from free profession, - income from property, - income from rental of a property or land, - social insurance benefits, - other social benefits, - other income (including gifts and alimonies). <p>The survey unit is a one-person or multi-person household. One-person household is defined as a self-sufficient person, i.e. not sharing his/her income with any other person, whether living alone or not. Multi-person household is defined as a group of persons living together and sharing their incomes and expenditures. The size of a household is understood as an total number of persons included in the household.</p> <p>The adopted sampling scheme was a geographically stratified and two-stage with different selection probabilities at the first stage. The sampling units for the first stage were the area survey points (asp) and those for the second stage were dwellings.</p> <p>The first stage sampling frame was based on the records of statistical areas (sets of areas) designed for the National Census purposes and updated annually by the changes resulting from the administrative division of the country as well as construction of new and dismantle of old houses. The sampling frame keeps in record information about every statistical area concerning address characteristics as well as the estimated numbers of inhabitants and dwellings. It was assumed that an urban area survey point should consist of at least 250 dwellings, while a rural one – 150 dwellings respectively. That is why small statistical areas were combined with the neighbouring ones. In total, about 30 000 area survey points were set up.</p> <p>In 2017 two subsamples, consisting of 783 asp each were used, i.e.</p> <ul style="list-style-type: none"> - subsample 1 – selected in 2015 for the surveys in 2016–2017, - subsample 2 – selected in 2016 for the surveys in 2017–2018. <p>Both subsamples were selected according to the same sampling scheme, but with different numbers of strata. Prior to sample selection, the asps were stratified. Each of the large cities (i.e., ones with population greater than 100,000) usually constituted a separate strata. In Warsaw, Łódź, Kraków, Poznań and Wrocław several strata were created by combining neighbouring districts. In turn, smaller cities and rural areas were stratified according by sub-region (NTS 3). The number of strata by voivodship ranged from 5 in the Opolskie and Świętokrzyskie to 27 in the Silesian voivodship. In total, 191 strata were created, out of which 58 were located in rural areas. It was assumed that each dwelling (household) should have the same sampling probability. That is why a sample of 675 asps was divided approximately in proportion to the number of dwellings in these strata. Starting from the year 2005, for the more precise results concerning farmers' households, the number of asps in rural areas were increased by 50%. Additionally, a sample of 108 rural asps was drawn and divided in proportion to the number of dwellings in rural strata.</p> <p>The second stage sampling frame was based on the registers of inhabited dwellings in the selected asps, prepared by the regional statistical offices. The selection of dwellings was done in accordance with the following rules:</p> <ol style="list-style-type: none"> the adopted model is full rotation with a monthly replacement of the sample; for each month 2 dwellings per asp are selected and all the households from these dwellings participate in the survey; every selected dwelling participates in the survey in the same month of the two consecutive years, i.e. 2016 and 2017 for subsample 1 and 2017 and 2018 for subsample 2;

	<p>IV. for every asp a supplementary sample of dwellings is selected in order to replace dwellings inhabited by households not participating in the survey. The dwellings from the supplementary sample are surveyed in the sequence of drawing as a replacement of not participating ones. Following the above guidelines, 24 dwellings were selected in every asp (2 for each month) and two supplementary samples with sizes depending on the size class of the locality: 250 dwellings in Warsaw, 200 dwellings in cities with population at least 500,000, 100 dwellings in all other cities, and 60 dwellings in rural areas..</p> <p>Because of non-participation of a number of households, there is a difference between a structure of the surveyed sample and that of selected one revealed by the socio-demographic traits. Therefore, the survey results were weighted with the 2011 National Census data broken by number of persons living in urban and rural areas.</p> <p>In 2017, there were 3132 dwellings surveyed every month. It was planned to obtain responses from households inhabiting 37 584 dwellings throughout the year 2017. The number of households actually surveyed was 36 665.</p> <p>(Source: "Household budget survey in 2017" Central Statistical Office (CSO), Warsaw 2018. Portugal

1. Data source

Name of data source for income categories:	ICOR (Inquérito às condições de vida e rendimento das famílias; Statistics Portugal)
Year of data source:	2016 (reference income period: 2015)
Type of data	
Sample survey data:	No
Register data:	Yes
Census data:	No
Description of survey:	<p>The Inquérito às Condições de Vida e Rendimento das Famílias (EU-SILC) has been held in Portugal since 2004, within the framework of specific EU legislation (Regulation (EC) No 1177/2003), establishing a common EU program for the systematic production of statistics on poverty, deprivation, and social exclusion.</p> <p>In Portugal, data are collected on an annual basis through Computer Assisted Personal Interviews (CAPI). The questionnaire includes questions on the household and also on each member's personal characteristics, particularly on the income of all members aged 16 and over. In 2017 the Survey was addressed to 14,053 households, of which 12,093 with a complete interview (data was collected on 30,012 persons; 25,852 aged 16 and over). Fieldwork usually takes place in the second quarter of each year.</p> <p>This survey aims to obtain results for all those residing in Portuguese territory in the reference period. For income, this reference period corresponds to the year prior to that when interviews are carried out.</p> <p>Households are selected by stratified two-stage sampling, from a sampling frame of dwellings of usual residence. The longitudinal nature of the sample, as well as the limitation of the statistical burden on respondents, are ensured by setting up an annual rotational scheme involving four independent sub-samples, each one being replaced every year. Hence, each household is interviewed four times at most, and thus the overlapping of 3/4 of respondents vis-à-vis the previous year is guaranteed.</p> <p>Up to 2012 the sample was selected exclusively from the Master Sample. However, from 2013 onwards a gradual transition of the latter to the new sampling frame was initiated (based on the National Dwellings Register – FNA in Portuguese). This transition took place over four years: between 2013 and 2015 dwellings selected from both sampling frames co-existed in the sample. As from 2016, the Survey annual sample, i.e. all four sub-samples is selected from the sampling frame based on the National Dwellings Register.</p> <p>Sampling selection follows a NUTS 2 stratified multistage sampling design, with primary sampling units (INSPIRE grid cells of 1km²) being selected with probability proportional to the number of dwellings of usual residence, and secondary sampling units (dwellings) selected systematically in each primary sampling unit. All households and individuals residing in the selected dwellings are interviewed.</p> <p>The estimated results are obtained using household and individual weights, calibrated by region, household size, age, and sex.</p>

Slovenia

1. Data source

Name of data source for income categories:	Data from Statistical Office of the Republic of Slovenia / Income and Living Conditions (SILC) for 2016. SILC is conducted on the basis of information obtained from a survey of living conditions and administrative and registry data for the year preceding the survey. National Statistical Office provides us relevant information in that regard as updated as possible. We checked data on the SILC 2016 data of Household's total net income.
Year of data source:	2016
Type of data	
Sample survey data:	Yes
Register data:	Yes
Census data:	No
Description of survey:	The basis is the raw information of the upper limits of deciles in household income in Slovenia calculated from the Statistics on Income and Living Conditions (SILC) for 2014 and 2016. SILC is conducted on the basis of information obtained from a survey of living conditions and administrative and registry data for the year preceding the survey. Households were classified in deciles according to the size of their annual disposable income. Monthly fee = annual amount / 12th

2. Income deciles

Switzerland

1. Data source	
If EU-SILC used, please name the variable(s) used:	HY010, PY090G ,PY110G, PY120G, PY130G
Name of data source for income categories:	EU-SILC
Year of data source:	2015/2016 (EU-SILC 2016)
Type of data	
Sample survey data:	Yes
Register data:	No
Census data:	No
Description of survey:	<p>SILC (Statistics on Income and Living Conditions) is a representative survey of households in Switzerland. This instrument aims at studying poverty, social exclusion and living conditions on the basis of indicators that are comparable at the European level.</p> <p>This yearly survey (from January to June) is carried out through telephone interviews (CATI). The persons who participate in the survey are interviewed for several years. This setting aims at describing the important stages in individual trajectories and at studying changes in living conditions.</p> <p>The FSO carries out a random sample register to conduct household surveys. This draws mainly from official cantonal and communal population registers. In order to make contact, the sample was completed as much as possible with telephone numbers that must be provided to the FSO by telephone providers. This list contains all private telephone connections, including those that do not appear in the publicly available telephone directory.</p>

Income decile table refers to:			
Weekly	No		
Monthly	No		
Annual	Yes		
Are the income figures adjusted to 2018 level?	No		
If no, please give the reason for not adjusting the benchmark data:	In exchange with the Statistical Office (SILC data), we agreed not to provide adjusted numbers as salaries in Switzerland are very stable and changes occur only for the very rich and the very poor, thus, an overall adjustment would just add bias. Furthermore, the confidence intervals of the estimates will be bigger than the adjustment of approximately 1%. Also, the estimate for the change of salaries includes only the employed, not the independent workers and it would be based on an estimate for 2018 based on information on the first quarter of 2018.		
Do the national benchmark data refer to the household's total income, after tax and compulsory deductions, from all sources?	No		
If no, please give the income definition used:	In principle, yes, the data refer to household's total income after tax and compulsory deductions. However, with the caveat that "after tax" means mainly after compulsory deductions only, as in Switzerland, taxes are based on wealth, income etc. of two years before more or less, and people do not know their income after taxes. On the other hand, what might be counted as tax in other countries, is in Switzerland based on insurance models which will be deducted as it is automatically deducted from salaries (or not even visible as employers pay it).		
Do the national benchmark data refer to household income for all households, unadjusted for size or type?	Yes

Income decile table refers to:

Weekly	Yes
Monthly	No
Annual	No
Are the income figures adjusted to 2018 level?	Yes
If income data are adjusted, please provide the formula for adjustment:	The FRS income data is from 2016/17. This was collected between April 2016 and March 2017 i.e. with a mid-point of October 2016. This was uprated for two years earnings growth to get to a figure for October 2018, during ESS 9 fieldwork. We used average earnings data to calculate the uprating factor. We used the average earnings index KAB9 weekly total earnings (including bonuses). We compared how the level increased across a 2-year period. In order to smooth out any monthly variations in the index, we took the average of the monthly index between Nov 2015 and April 2016 and compared this with the average of the monthly index between Nov 2017 and Apr 2018. The average index increased 4.91% over these two years. FRS income thresholds were therefore be uprated by 4.91%.
Do the national benchmark data refer to the household's total income, after tax and compulsory deductions, from all sources?	Yes
Do the national benchmark data refer to household income for all households, unadjusted for size or type?	Yes
